Abstract

5   As part of the system and method of the present invention, either a Client

Agent and/or a Predictive Server intercept a request from a client to a server, and a

response from the server to the client. Based on information derived from the

client/server communication, either the Client Agent or the Predictive Server

generates a predictive request for data. The server's response to the predictive request

10   is stored at either the Client Agent or the Predictive Server, and is forward to the client

when the client generates a request for the data contained in the response.
